

**IN THE CLAIMS:**

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strikethrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

Please **CANCEL** claim 2 without prejudice or disclaimer, **AMEND** claims 1 and 4 in accordance with the following:

**Claim 1 (Currently Amended):** A sensor network system comprising;  
a sensor chip which can transmit measurement values by wireless communication;  
a sensor database which stores the measurement values measured by the sensor chip;  
a sensor information management unit which manages access to the sensor database;  
a receiver which receives the measurement values from the sensor chip and accesses  
the sensor information management unit via a network;  
a map database which stores, as map information, data about equipment in which the  
sensor chip is installed;  
a map information management unit which manages access to the map database; and  
a sensor management device which registers a location where the sensor chip is  
installed in the map database.

wherein the sensor management device comprises:  
a memory which stores a program and data;  
a CPU which executes the program and controls operation;  
an ID reading unit which reads identification information assigned to the  
sensor chip;  
an own position measuring unit which acquires a present position of the  
sensor chip;  
a wireless communication unit which can connect to the network by  
wireless communication;  
a sensor information setting unit which inputs and outputs information  
about the sensor chip; and

a display unit and an input unit both of which are controlled by the sensor information setting unit.

**Claim 2 (Canceled):**

**Claim 3 (Original):** The sensor network system according to claim 1, wherein the sensor chip has a stake-shaped container which can be put in the ground as an exterior package.

**Claim 4 (Currently Amended):** The sensor network system according to claim 21, wherein the display unit displaysincludes:  
a sensor information acquisition button,  
a sensor information display unit,  
a neighborhood information display unit which displays data about the equipment as neighborhood map information,  
a cross-shaped reference icon which appears in the neighborhood information display unit and which indicates a present position of the sensor chip, and  
an enter button which is used to register the sensor information and the equipment data in a state of being associated with each other.

**Claim 5 (Previously Presented):** The sensor network system according to claim 4, wherein the sensor management device comprises:  
means for detecting pressing of the sensor information acquisition button,  
means for making the ID reading unit acquire the identification information having been encoded,  
means for decoding the sensor information based on the identification information acquired, and  
means for displaying the sensor information in the sensor information display unit.

**Claim 6 (Original):** The sensor network system according to claim 4, wherein the sensor management device comprises:  
means for detecting pressing of the sensor information acquisition button,

means for making the ID reading unit acquire the identification information,  
means for making the wireless communication unit access the sensor information management unit,  
means for transmitting the identification information,  
means for making the sensor information management unit acquire a sensor ID from the identification information,  
means for making the sensor information management unit search the sensor database using the sensor ID as a key and acquire corresponding sensor information,  
means for transmitting the sensor information to the sensor information setting unit, and  
means for displaying the sensor information in the sensor information display unit.

**Claim 7 (Previously Presented):** The sensor network system according to claim 6, wherein the sensor management device comprises:

means for displaying, when pressing of the enter button is detected with the neighborhood information display unit being selected and with an equipment icon displayed in the neighborhood information display unit being selected, a sensor icon at a position where the equipment icon is displayed,

means for accessing the map information management unit upon confirming a combination of the equipment icon and the sensor icon, and

means for associating the sensor ID with data being associated with the equipment icon, the data being included in the map database.

**Claim 8 (Previously Presented):** The sensor network system according to claim 7, wherein the display unit displays the equipment icon, when it is selected, differently from other equipment icons.

**Claim 9 (Previously Presented):** The sensor network system according to claim 7, wherein the sensor management device comprises:

means for displaying, when pressing of the enter button is detected with the neighborhood information display unit being selected, the sensor icon at a position of the reference icon,

means for accessing the map information management unit upon confirming a position of

the sensor icon, and

means for associating the position with data associated with the sensor icon, the data being included in the map database.

**Claim 10 (Previously Presented):** The sensor network system according to claim 6, wherein the map information management unit detects selection of the equipment data, acquires the associated sensor ID from the map database, and acquires the measurement values associated with the sensor ID, the measurement values being accumulated in the sensor database.
